Название:	Fourth Industrial Revolution and Emotional Intelligence: A Conceptual and Scientometric Analysis
Авторы:	Campa, R.
Дата публикации:	2020
Издатель:	Уральский федеральный университет Ural Federal University
Библиографическое описание:	Campa R. Fourth Industrial Revolution and Emotional Intelligence: A Conceptual and Scientometric Analysis / R. Campa // Changing Societies & Personalities. — 2020. — Vol. 4. Iss. 1. — P. 8–30.
Аннотация:	<p>A growing number of social scientists argue that we stand on the brink of a technological revolution that will drastically change the way we live, learn, and work. One of the terms adopted to name this social phenomenon is “fourth industrial revolution”. Other social scientists, in particular psychologists, have independently elaborated and discussed a concept of intelligence which is complementary, and sometimes alternative, to that measured by traditional IQ tests, namely “emotional intelligence”. In recent years, these two concepts came into contact and started interacting in scientific literature. Enhancing EI in educational programs has been seen as a possible way to prevent a predicted negative side effect of the fourth industrial revolution, namely technological unemployment. This article provides a diachronic scientometric analysis of terms and concepts. Quantitative and qualitative research tools are applied in order to reconstruct the dynamics of the Emergence, Frequency, Proximity, and Relation (EFPR dynamics) of the two concepts in the scientific literature.</p>

According to Oosthuizen's [53] Fourth Industrial Revolution Intelligence framework, a high degree of emotional intelligence will create positive relations and trust among team members and will make teams more creative, agile, resilient in a fast-changing workplace environment. Furthermore, in an empirical study on employee competency for Industry 4.0, experts in this field have claimed that social competency will have direct impact in 4IR industries. The Fourth Industrial Revolution (or Industry 4.0) is the ongoing automation of traditional manufacturing and industrial practices, using modern smart technology. Large-scale machine-to-machine communication (M2M) and the internet of things (IoT) are integrated for increased automation, improved communication and self-monitoring, and production of smart machines that can analyze and diagnose issues without the need for human intervention. Fourth Industrial Revolution and Emotional Intelligence: A Conceptual and Scientometric Analysis. A growing number of social scientists argue that we stand on the brink of a technological revolution that will drastically change the way we live, learn, and work. One of the terms adopted to name this social phenomenon is "fourth more. The Fourth Industrial Revolution is here—are you ready? Deloitte helps organisations understand the opportunities and risks presented by the Fourth Industrial Revolution and apply that insight in pursuit of key objectives. HE concept of digitising everything is becoming a reality. Automation, artificial intelligence, IoT, machine learning and other advanced technologies can quickly capture and analyse a wealth of data that gives us previously unimaginable amounts and types of information to work from. Our challenge becomes moving to the next phase—changing how we think, train and work using data—to create value from the findings obtained through advanced technologies.”
