Embryology/histology sections seem both too detailed (eg. listing a variety signalling molecules and matrix components without necessarily explaining their role) and too weak in painting an overall picture of what is happening. This makes for a slow read where I constantly have sort what is important to know and what's putative conjecture -- I personally had a better experience reading Ten Cate's book (which is also very detailed but perhaps better written).

Dental and oral histology with embryology is very important basic science and lays down the foundation for all clinical subjects and paraclinical subjects. Thorough knowledge of basic sciences is very essential for a more rationale foundation of clinical procedures. A better understanding of basic sciences can make a difference between an inventor-cum- researcher and one with outdated knowledge, between an excellent clinician and another clinician who treats the patients only like a technician, between one who leads and another one who follows.
