21 INTRODUCTION  
22

23 In calling for Congress and the President to start a national Adolescent Literacy  
24 Initiative, the Alliance for Excellent Education noted that approximately six  
25 million middle school and high school students have very low literacy levels that  
26 not only affect their achievement in English and language arts classes, but that  
27 also make it very difficult for them to master content in other subjects (Joftus,  
28 2002). These students typically have mastered word attack skills (and some can  
29 even read aloud smoothly and with expression) but have very low comprehension  
30 (Balfanz, McPartland & Shaw, 2002a; Buly & Valencia, 2002; Snow, 2002).

31 The adolescent literacy crisis is not one that affects all schools equally. Young  
32 adults who are poor comprehenders are much more likely to be found in high  
33 poverty, high minority schools than in other schools. It is not unusual for over  
34 70% of the eighth-graders in high poverty, high-minority middle schools to  
35

1 comprehend at “below basic” levels (Balfanz, Spiridakis & Neild, 2002c). Due,  
2 at least in part, to not receiving the learning opportunities and support they  
3 needed in middle school, less than 50% of eighth-graders from high-poverty high  
4 minority schools graduate from high school in five years (Balfanz & Legters,  
5 2001). In fact, many of these students never even make it to tenth grade (Neild &  
6 Balfanz, 2001; Neild, Stoner-Eby & Furstenberg, 2001) partly because they find it  
7 difficult to take in new knowledge independently by reading as required by the high  
8 school curriculum.

9 One reason for the adolescent literacy crisis is that America has focused too  
10 exclusively on early reading. Educators, policy makers and high-profile literacy  
11 movements have all focused on “reading by nine” as if kids can learn all they need  
12 to learn about reading in the early grades and – if given the right kinds of early  
13 instruction and experience – will almost inevitably make a smooth transition to  
14 higher levels of literacy. Partly as a result of the priority given to early reading,  
15 fourth graders in the United States perform close to the very top in international  
16 assessments of early reading, but this achievement advantage diminishes in the  
17 middle and high school grades (Snow, 2002). For example, in the 1990–1991  
18 academic year, only Finland beat the United States in fourth grade reading scores  
19 in one international study of 32 countries, but American ninth-graders were tied for  
20 eighth place (Elley, 1992). While an 8th place ranking in young adolescent literacy  
21 is neither praiseworthy nor alarming, it *is* alarming that “the U.S. is the world leader  
22 in literacy inequality among young adults” (Sum, Kirsch & Taggart, 2002, p. 26).  
23 This level of inequality reflects the huge gap in skills between the hundreds of  
24 thousands of middle grades students (concentrated mainly in high poverty schools)  
25 who can barely comprehend text of any complexity and the hundreds of thousands  
26 of middle grades students (concentrated in more advantaged schools) who develop  
27 relatively sophisticated literacy skills. The adolescent literacy challenge is to close  
28 this gap so that all middle grades students can – by the time they enter high  
29 school – “read a variety of materials with ease and interest, can read for varying  
30 purposes, and can read with comprehension even when the material is neither easy  
31 to understand nor intrinsically interesting” (Snow, 2002, p. xiii).

32 But how can we successfully meet this challenge? Carol Midgley was a pioneer  
33 in suggesting that students in the middle grades could attain higher achievement  
34 and would develop and maintain adaptive achievement-related attitudes, values,  
35 and motivational orientations if certain key aspects of their classroom environment  
36 were reformed. One theme that pervaded both her early work (e.g. Midgley, 1987;  
37 Midgley, Feldlaufer & Eccles, 1988, 1989) and her later work (e.g. Midgley, 2002)  
38 was the paramount importance of teachers’ beliefs, behaviors, and classroom  
39 practices in powerfully influencing student achievement and motivation. For  
40 example, in analyzing the beliefs of middle grades teachers, Midgley’s early work

1 documented how they were less likely than elementary teachers to feel efficacious  
2 (e.g. to be certain that they are making a difference in the lives of their students, to  
3 be confident in their ability to get through to even the most difficult or unmotivated  
4 students, and to be able to help most of their students achieve at a high level).  
5 She also found that middle grades teachers were less likely than elementary  
6 teachers to trust students to work together productively, were very concerned  
7 about student misbehavior and maintaining control of their classrooms, and often  
8 provided their students with academic tasks that were *less* demanding cognitively  
9 (Midgley, 1993).

10 Unfortunately, these problems still have not been resolved. For example,  
11 middle grades teachers are still more likely than elementary teachers to doubt  
12 their personal teaching efficacy (Marachi, Gheen & Midgley, 2000; Roeser,  
13 Marachi & Gehlbach, 2002). Middle grades teachers, especially in high poverty  
14 schools, still feel that student behavior is out of control in the classroom and in the  
15 hallways (Balfanz, Ruby & MacIver, 2002b; Useem, 2003) and few feel capable  
16 of managing the hands-on and cooperative group activities that are needed to teach  
17 a state-of-the-art instructional program that focuses on understanding (MacIver  
18 et al., 2000; MacIver, Young & Washburn, 2002; Ruby, 1999). Worst of all, in  
19 high-poverty middle schools, far too many students experience “learning-bereft”  
20 classrooms where – in one or more core subjects – an entire school year is in fact  
21 “wasted” (Corbett & Wilson, 1997, p. 27) either because the class is taught by  
22 a teacher unwilling or unable to explain concepts, problems, or assignments in a  
23 way that students can understand or because the class is disruptive (which results  
24 in the class being taught by multiple teachers if the initial teacher resigns).

25 One major reason why so many middle school teachers are inefficacious is that  
26 they typically have little specific preparation to teach at the middle school level.  
27 Because of the lack of teacher education programs and licensure that focus on  
28 the middle school level, the majority of young adolescents are taught by teachers  
29 who prepared for a career as an elementary or high school teacher. Fewer than  
30 one in four middle-grades teachers have received specialized training to teach at  
31 the middle school level before they begin their careers (Jackson & Davis, 2000;  
32 McEwin & Dickinson, 1997; McEwin, Dickinson & Jenkins, 1996; National  
33 Forum to Accelerate Middle Grades Reform, 2002).

34 It is, therefore, not surprising that schools have long had difficulty in attracting  
35 and retaining middle grades teachers. Teachers who are elementary-certified  
36 or who have secondary certification(s) understandably prefer placements in  
37 elementary schools and high schools, respectively, often accepting middle school  
38 positions only as a last resort (Useem, 2001). And those who do accept such a  
39 position struggle to be and feel efficacious because they are assigned to subject  
40 areas and/or grade levels for which they are underqualified. For example, an

1 elementary-certified teacher may be well-prepared to teach beginning reading  
2 but may have little idea how to assist middle grades students in mastering the  
3 intermediate skills that need to be developed in the middle grades. Even a  
4 secondary-certified English teacher who accepts a middle grades assignment is  
5 often at a loss in teaching intermediate skills because his/her preparatory courses  
6 and field experiences assumed that he/she would be teaching mainly students who  
7 had already mastered such intermediate skills and would be ready for the more  
8 advanced curriculum and instruction of a high school program.

9     Though middle school staffing is often a challenge even in suburban and rural  
10 districts, efforts to improve literacy in high-poverty urban middle schools are  
11 particularly “hampered by the inadequate preparation levels of many teachers,  
12 the common practice of assigning teachers to courses for which they have no  
13 specialized knowledge, and the rapid turnover of schools’ instructional staff  
14 from year to year” (Useem, 2001, p. 144; see also, Balfanz & MacIver, 2000;  
15 Cooney, 1998; Cooney & Bottoms, 2003; Ingersoll, 1999; McEwin & Dickinson,  
16 1995; Ruby, 2002; Strauss, 1999; Useem et al., 1997). Building and sustaining  
17 momentum in middle grades reform is complicated when the typical urban middle  
18 school has a significant outflow of veteran teachers and a large inflow of new  
19 or relatively inexperienced teachers or uncertified teachers, and several unfilled  
20 vacancies each year. For example, in the 1999–2000 school year in Philadelphia,  
21 14% of the teachers in that city’s middle schools were new, on average. A study  
22 of a subsample of 60 of these new teachers indicated that only 10% of the  
23 teachers preferred teaching in the middle grades and that only 14% had gained  
24 experience in the seventh or eighth grade as student teachers (Useem, 2001). Of  
25 the new teachers assigned to teach reading/English language arts (RELA), Useem  
26 classified 42% of them as “poorly prepared” because they had zero to two courses  
27 in that content area and no RELA teaching methods course, or a methods course  
28 but only zero or one course in the content area, or had no pedagogy coursework  
29 at all. In most of these cases, the teachers themselves also indicated during an  
30 interview that they were not qualified to teach RELA in the middle grades. After  
31 three years, only 19 of the 60 teachers (32%) remained at their original schools  
32 (Useem, 2003).

33     Another factor limiting the achievement of many middle school students –  
34 in addition to receiving instruction from teachers who are underprepared and/or  
35 feel inefficacious – is that their schools are in need of redesign with student  
36 motivation in mind. Midgley and her colleagues were perhaps the first to argue  
37 for a schoolwide approach to enhancing student motivation. They recognized  
38 the practical need to teach middle grades educators how to alter curriculum  
39 and instruction, authority structures, recognition practices, grouping practices,  
40 evaluation and assessment procedures, and time use throughout the school in

1 ways that increase the emphasis on task mastery, academic progress and learning  
2 for its own sake (Maehr & Midgley, 1991, 1996; Midgley, 1993).

3 For example, Midgley helped middle schools to reconsider the practice of  
4 sorting students into classes or tracks by “ability.” The motivational problems  
5 and disappointing performance displayed by many students is a direct result of  
6 having been assigned to a lower ability class that is denied the more challenging,  
7 content-rich, higher-quality instructional program that some students in the school  
8 receive. Not only does between-class ability grouping in the middle grades cause  
9 gross inequalities in students’ access to knowledge, instructional resources, and  
10 well-qualified teaching (Wheelock, 1992), it promotes a focus on competition  
11 and relative ability rather than a focus on task mastery (Maehr & Midgley, 1991;  
12 Midgley, 1993). According to the goal-theory approach to motivation that Midgley  
13 championed, when students are more “ability focused” than “task focused,” they  
14 are less likely to develop a sense of efficacy and a willingness to try hard, take on  
15 challenges, and persist in the face of difficulty (Maehr & Midgley, 1991, 1996).

16 Similarly, Midgley and her colleagues called for increased opportunities for peer  
17 interaction and cooperation that allow students to experience greater autonomy and  
18 develop responsibility, leadership skills, social skills and skills in self-regulation.  
19 She called for an overhaul of assessment and evaluation practices to de-emphasize  
20 social comparison and to instead help students accurately gauge their progress in  
21 meeting their goals and purposes and in developing their skills and understand-  
22 ings. She suggested revising middle school schedules to allow teachers extended  
23 periods so that there would be time for “teaching for understanding” instructional  
24 approaches that move away from a traditional lecture, recitation, and seatwork  
25 format in favor of active, hands-on, cooperative, and project-based approaches  
26 to learning.

27 For educators seeking to address the adolescent literacy crisis in high poverty  
28 middle schools, a key implication of Midgley’s work is that the learning opportuni-  
29 ties and learning environments that students experience day-to-day have a dramatic  
30 impact on their motivational orientations and thereby promote or inhibit students’  
31 willingness and capacity to do what it takes to become proficient and voracious  
32 readers. Students need high-quality mastery-focused learning opportunities in  
33 every classroom every day. Students also need a supportive, “no excuses” learning  
34 environment (Wilson & Corbett, 2001) where teachers push students to under-  
35 stand; where extra help, enrichment, and emotional and social support are provided  
36 to all; and where communal organization structures (Balfanz, Ruby & MacIver,  
37 2002b) help students and teachers develop strong bonds and a shared sense of  
38 purpose that allow innovative and adaptive teaching and deep learning to flourish.

39 But, in order to reliably provide students with the opportunities and supports  
40 they need, teachers need extensive materials, training, and in-classroom support.

1 Specifically, teachers' ability to promote meaningful learning, to adapt instruction  
2 to the levels and interests of students, and to support student autonomy and  
3 peer collaboration can be greatly enhanced by providing teachers with: (1)  
4 a coherent curriculum that is coordinated and builds grade by grade; (2) the  
5 essential supplies and learning materials they need to teach; (3) on-going subject  
6 and grade-specific professional development which helps them gain the content  
7 knowledge, instructional strategies, classroom management advice, and hands-on  
8 experience they need to successfully implement the instructional program; and  
9 (4) in-classroom assistance from a respected peer who is there to support rather  
10 than evaluate (MacIver, Young, Balfanz, Shaw, Garriott & Cohen, 2001). In short,  
11 a solid foundation of sustained support and learning opportunities for teachers is  
12 needed to overcome the middle school teacher staffing crisis that is preventing so  
13 many students in high poverty middle schools from receiving mastery-oriented  
14 instruction from confident and efficacious teachers.

15 The Talent Development Middle School model is a national comprehensive  
16 school reform especially designed for high poverty middle schools (Balfanz,  
17 Ruby & MacIver, 2002b; MacIver et al., 2003). The model involves reforms  
18 that are research-based and mastery-focused. The reforms are phased-in over  
19 multiple years and involve major changes in a school's curriculum and instruction,  
20 professional development and instructional coaching, school organization and  
21 climate. This chapter reports results from the first three schools to implement  
22 Talent Development's instructional program in reading/English language arts  
23 (RELA). In three related studies, we examine the impact of the reforms on reading  
24 achievement, on classroom practices, and on selected motivation-related outcomes.

25  
26  
27 *Talent Development's Instructional Program in*  
28 *Reading/English Language Arts*  
29

30 A basic feature of the TD program is to double English instructional time by of-  
31 fering 90-minute classes all year. The instructional program used in these classes,  
32 Johns Hopkins University's *Student Team Literature/Talent Development Writing*,  
33 is a comprehensive middle school language arts curriculum that is designed to  
34 ensure students develop intermediate skills and meet middle grade standards in  
35 reading, language arts, and writing. The National Staff Development Council  
36 selected the Student Team Literature Program for inclusion in its "consumer's  
37 guide" of effective programs (Killion, 1999). The program emphasizes improving  
38 students' skills in reading comprehension, vocabulary, literary analysis, writing,  
39 and student collaboration, using outstanding literature, higher-level question-  
40 ing, literature-related writing, and working with other students. It includes:

Pl. check the ref.  
"Killion (1999)",  
which is missing in  
the ref. list.

1 (1) curricular materials (teaching guides and Partner Discussion Guides for over  
2 130 books) to assist students’ study of high-quality fiction and non-fiction books  
3 that are age-appropriate and culturally diverse; and (2) mastery-focused activities,  
4 instructional practices, peer assistance processes, and assessments. Student Team  
5 Literature Partner Discussion Guides include literature-related writing activities  
6 (e.g. “Write a newspaper article and headline about the bombing in Birmingham,  
7 “Write a poem about the Watsons’ trip to Alabama.”), a systematic study of the  
8 writer’s craft as displayed in the book being studied (e.g. activities in which  
9 students interpret the impact of author’s word choice, symbolism, and literary  
10 elements), and mini-lessons that focus on particular reading strategies, language  
11 arts objectives, or literary skills in the context of the literature being studied.

12 Talent Development Writing complements Student Team Literature and extends  
13 the explicit teaching and practice of writing, critical reading, editing, and revision.  
14 It emphasizes preparing students for the writing assignments through modeling  
15 activities where teachers think aloud and demonstrate their own approach to  
16 writing and “springboard activities” intended to spark the creative process and  
17 fill gaps in students’ knowledge that make it difficult for them to generate content  
18 in response to a writing assignment. It also uses teacher-student conferences and  
19 conferences with student partners to provide students with the kind of targeted  
20 help they need in order to become more proficient.

21  
22

23 *Sustained Subject-Specific Professional Development and*  
24 *In-Classroom Coaching*

25

26 Teachers were offered multiple tiers of professional development linked to the  
27 implementation of Talent Development’s instructional program in RELA. Several  
28 days of summer training were followed by monthly three-hour workshops and  
29 weekly coaching during and after classroom visits by an expert RELA instructor  
30 who was an adolescent literacy specialist.

31 The summer workshops introduced Student Team Literature as a research-based  
32 cooperative approach to teaching literature that strengthens students’ reading,  
33 thinking, writing, and social skills. Teachers were provided with a baseline of  
34 knowledge, modeling, and simulations of each of Student Team Literature’s  
35 major components: high quality books written for adolescent readers that reflect  
36 their experiences, problems, and cultures; Partner Discussion Guides (reading  
37 comprehension guides written to accompany each book that include a wide  
38 variety of activities which lead students to become critical thinkers whose  
39 working vocabularies expand and whose knowledge of reading strategies and of  
40 the writer’s craft increases with each book); the cycle of instruction (background

1 building, previewing and predicting, direct instruction and modeling, silent  
2 reading, partner reading, partner or team practice and discussion, vocabulary  
3 building discussions and activities to help students learn new words and practice  
4 using them in appropriate and familiar contexts, independent response activities,  
5 guided whole-class discussion, literature-related writing and extension activities,  
6 individual assessment); and Listening Comprehension/Read Aloud activities  
7 used to teach students how proficient readers make meaning of text, how good  
8 writer's write and how to recognize and interpret literary elements and devices.  
9 In addition, teachers were given tips, methods, and hands-on activities designed  
10 to assist them in teaching social skills to their students, in managing a cooperative  
11 learning classroom, and in forming and sustaining successful student teams.

12 The monthly seminars allowed teachers to troubleshoot problems with  
13 instruction and to extend their knowledge and skills. Topics included selecting  
14 appropriate literature, teaching the composition of "meaningful sentences";  
15 fluency, vocabulary, and comprehension assessments and interventions, differ-  
16 entiating instruction, using mini-lessons to teach reading, writing, and grammar  
17 skills; addressing the needs of English Language Learners; organizing Book  
18 Talks; strategies for teaching non-fiction literature; teaching students to organize  
19 information; movement-oriented activities; and several others. Time was also  
20 provided for the teachers to dialogue with each other about what was and was not  
21 working in their classrooms. Make-up sessions were offered as needed.

22 In all, teachers had access to over 36 hours of professional development per year.  
23 Following the union contract, attendance was voluntary and teachers were paid  
24 the district rate for attending training outside of the school day (approximately  
25 20 dollars per hour). Beginning in 1998, arrangements were made with a local  
26 university to provide teachers with 3 graduate course credits if they completed 36  
27 hours of training and related assignments.

28 In addition to the professional development sessions, teachers had access  
29 to in-classroom implementation support from a curriculum coach. Each Talent  
30 Development school was assigned a RELA curriculum coach who spent one to two  
31 days per week in each school working with RELA teachers in their classrooms.  
32 The curriculum coach was an experienced teacher – in some cases a Talent  
33 Development employee and in some cases a district teacher on special assignment  
34 to Talent Development. The implementation support was non-judgmental and  
35 varied from classroom to classroom but included modeling, explaining, co-  
36 teaching, assistance with lesson planning, observing lessons and providing confi-  
37 dential feedback, and making sure that the teacher had all the materials and training  
38 needed to implement the instructional program. The curriculum coach also worked  
39 with the teacher to make modifications to the curriculum based on the needs of  
40 each class.

1 In sum, the three Talent Development Middle Schools studied here made extensive and intensive whole-school changes involving organizational, instructional, and professional development reforms. The studies that follow compare these schools with matched control schools to examine how powerful these reforms were in producing changes in students' achievement, motivation and classroom experiences in RELA.

7  
8  
9 *Study 1: Reading Achievement Gains*

10  
11 *Schools, Data, and Methods*

12 All the middle schools in the study are large non-selective neighborhood schools in Philadelphia which serve low-income minority populations. In all three Talent Development schools, over 80% of the professional staff voted by secret ballot to implement the Talent Development Middle School whole school reform model. The Student Team Literature program described in this chapter is a central feature of the model and the staff at each school was aware that voting for the model meant, among other things, that they were voting to implement this program in the school's reading/English language arts classes.

16 The school district of Philadelphia selected comparison schools that were similar to the participating schools in racial composition, high poverty status, and past performance during the period before Talent Development began in the district. These comparison schools are used in the impact analyses to assess the extent to which the achievement growth for students in Talent Development schools is different from those in similar schools that do not attempt to implement Talent Development's instructional programs.

27 The most important question addressed in this study is whether the reading achievement growth of students in the first three schools to implement the Talent Development Middle School Model's Student Team Literature instructional program was significantly higher than the growth of students in three matched comparison schools. The analysis includes longitudinal data from two cohorts of students. The first cohort of students were 5th-graders in Spring 1997 and 8th graders in Spring 2000. The second cohort of students were 5th graders in Spring 1998 and 8th graders in Spring 2001. Achievement in 5th- and 8th-grade is measured by students' normal curve equivalent scores (NCEs) in reading on the Pennsylvania System of School Assessment (PSSA) using statewide norms. The analysis includes all students who attended one of the three Talent Development Schools or one of the three comparison schools during 6th, 7th, and 8th-grade. Fifth- and eighth-grade achievement data were available for 1,552 of the students in the two cohorts. As shown in [Table 1](#), at the end of fifth-grade, there was not a

**Table 1.** Characteristics of Students who Attended Talent Development and Comparison Middle Schools.

Characteristic	Type of School		<i>t</i> test	
	Talent Development ( <i>n</i> = 890)	Comparison ( <i>n</i> = 662)	<i>t</i>	<i>p</i>
Average 5th-grade normal curve equivalent in reading	25.4	25.9	-0.56	0.57
Female (%)	54	55	-0.54	0.59
Special education (%)	17	13	1.90	0.06
ESL (%)	15	11	1.92	0.06
Asian (%)	9	7	1.40	0.16
Hispanic (%)	39	43	-1.61	0.11
Black (%)	48	36	4.78	0.000
White (%)	4	14	-6.61	0.000

significant difference between the reading achievement of those who would attend Talent Development Middle Schools in 6th-8th grade and those who would attend the comparison schools. There were minor differences, however, in the racial composition of the comparison schools and the Talent Development schools: the comparison schools had somewhat fewer black students and somewhat more white students than did the Talent Development schools.

We used a 3-level HLM to analyze reading achievement in fifth- and eighth-grade. There were two records for each student, one from fifth grade and one from 8th grade. We modeled students' normal curve equivalent scores as a function of grade (a dummy variable coded "0" if the score was from a student's fifth-grade year, and "1" if the score was from a student's 8th grade year). Thus, the coefficient for the "intercept" represents prior achievement in Spring of fifth grade and the slope coefficient for "grade" represents the growth between the Spring of 5th and the Spring of 8th grade. At level 2, the student level, we took account of the higher prior reading achievement of female and Asian students and the lower prior reading achievement of students for whom English is a second language by including dummy variables as covariates predicting the level 1 intercept. (Additional analyses, not reported here, showed that student gender, race, and English Language Learner status were *not* significant predictors of achievement *growth* between fifth and eighth grade. Thus, these variables were not included as predictors of the level-1 slope in the analysis reported here.) At level 3, the school level, we estimated the impact of Talent Development's Student Team Literature program on students' reading achievement growth by including a

1 dummy variable indicating whether the school was a Talent Development school  
 2 or not as a predictor of the slope coefficient from level 1.

3 This analysis can be summarized in equations as follows:

4 Level-1 Model

5  
 6 
$$Y = P0 + P1(EIGHTH) + E$$

7  
 8 Level-2 Model

9  
 10 
$$P0 = B00 + B01(FEMALE) + B02(ESOL) + B03(ASIAN) + R0$$

11 
$$P1 = B10$$

12  
 13 Level-3 Model

14 
$$B00 = G000 + U00$$

15 
$$B01 = G010$$

16 
$$B02 = G020 + U02$$

17 
$$B03 = G030 + U03$$

18 
$$B10 = G100 + G101(TAL.DEV.) + U10$$

19  
 20  
 21 **Table 2** lists the coefficient estimates from this HLM model. The first part of the  
 22 results shows student characteristics that predicted prior achievement (at the end of  
 23 fifth grade). Specifically, girls and Asians had higher prior reading achievement  
 24 than did other students and English-Language Learners had lower prior reading  
 25 achievement. These results reflect the fact that, in high-poverty neighborhoods,  
 26 males, blacks, Hispanics, and students who have limited English proficiency enter  
 27 middle school particularly far behind state norms in reading.

28  
 29 **Table 2.** Modeling Prior Reading Achievement and Reading Achievement  
 30 Growth: HLM Estimates.

31

32 Fixed Effect	Coefficient	SE	<i>p</i>
33 Model for P0 (NCE score in Spring of 5th grade)			
34 Intercept	24.8	1.12	0.000
35 Female	2.3	0.56	0.000
36 ESOL	-8.6	1.68	0.003
37 Asian	8.7	2.40	0.024
38 Model for P1 (growth between Spring of 5th grade and Spring of 8th grade)			
39 Intercept	2.5	0.81	0.043
40 Talent development	4.3	0.66	0.000

1 The final part of the model tests whether it was an advantage to attend a Talent  
2 Development Middle School. Specifically, the coefficient associated with the  
3 Talent Development dummy variable indicates the average cumulative size of  
4 the Talent Development advantage in reading growth during the middle grades  
5 across two cohorts and multiple schools. This advantage was equal to 4.3 NCEs.  
6 Using the most conservative method of computing effect sizes for achievement  
7 gains, the effect in standard deviation units is 0.29. (This conservative estimate  
8 uses the standard deviation from the original distribution of 1,552 students'  
9 reading achievement normal curve equivalent scores in fifth-grade – 15.0 – as the  
10 denominator.). However, since Talent Development is a school-level intervention  
11 (a school is either a TD middle school or not), it is also meaningful to express the  
12 effect in school-level standard deviation units. The school-level standard deviation  
13 from the original distribution of school mean prior achievement scores in fifth  
14 grade was 3.3. Thus, the school-level effect size is equal to 1.3 (4.3/3.3). In other  
15 words, the adjusted mean achievement growth in the three TD schools from the end  
16 of fifth to the end of eighth grade was 1.3 standard deviations more than in the three  
17 comparison schools.

#### 18 *Educational Significance of the Achievement Gains*

19 These effect size estimates suggest that reading achievement gains attained in  
20 Talent Development Middle Schools were educationally significant. Another  
21 way to show the program's impact is to examine the percent of students making  
22 substantial gains (more than 5 NCEs) vs. state norms between 5th and 8th grade.  
23 As shown earlier in Table 1, the students in Philadelphia's high poverty schools  
24 end fifth grade substantially behind state norms (performing at about the 25th  
25 NCE which is equivalent to the 12th percentile). It is essential to assist significant  
26 numbers of these students to catch-up during the middle grades so that they leave  
27 middle school in a substantially better position relative to statewide norms. Table 3  
28 shows that 54% of the students in Talent Development schools (versus just 45%  
29 of the students in the comparison schools) gain over five normal curve equivalents  
30 during the middle grades. Table 3 also shows that it was an advantage to be in  
31 a Talent Development school regardless of students' prior achievement. This  
32 advantage in the percentage of students making substantial gains was significant  
33 for the whole sample, and also for students whose achievement at the end of the  
34 elementary grades was between the 25th and 50th NCE.  
35

36 The PSSA is typically used as a norm-referenced test. However, its developers  
37 have also created four criteria-based categories to identify the reading proficiency  
38 of each student. These categories include Below Basic, Basic, Proficient, and  
39 Advanced. To gain a deeper understanding of the effects of the Talent Development  
40 instructional program in RELA, we examined the level of reading proficiency

**Table 3.** Percent of Students Who Gained Over 5 NCEs in Reading Achievement Between the End of 5th- and End of 8th-Grade.

Starting Point of Student at End of 5th Grade (in NCEs)	Type of School		Difference (%)	<i>t</i> Test	
	Talent Development (%)	Comparison (%)		<i>t</i>	<i>p</i>
0–14.9	85 ( <i>n</i> = 201)	79 ( <i>n</i> = 168)	+ 6	1.63	0.11
15–24.9	52 ( <i>n</i> = 223)	48 ( <i>n</i> = 146)	+ 4	0.85	0.40
25–39.9	45 ( <i>n</i> = 330)	32 ( <i>n</i> = 231)	+ 13	3.15	0.002
40–49.9	33 ( <i>n</i> = 85)	13 ( <i>n</i> = 75)	+ 20	2.97	0.003
50–99.9	33 ( <i>n</i> = 51)	26 ( <i>n</i> = 42)	+ 7	0.74	0.46
All students	54 ( <i>n</i> = 890)	45 ( <i>n</i> = 662)	+ 9	3.63	0.000

achieved by the end of eighth grade by students in Talent Development and comparison schools. By the end of eighth grade, students in Talent Development schools were significantly more likely to be classified as at least “proficient” (satisfactory academic performance indicating a solid understanding). That is, 17% of the Talent Development students but only 12% of the comparison students had achieved the goal of being proficient readers,  $t(1550) = 2.89, p = 0.004$ . Further, Talent Development students were less likely to be classified as in the lowest achievement category,  $t(1550) = -2.42, p = 0.016$ . Specifically, 63% of the comparison students but only 57% of the Talent Development students were classified as “below basic” in reading.

*Study 2: Classroom Experiences*

As indicated earlier, Talent Development seeks to improve students’ learning opportunities in reading/English language arts by having students study appealing, high-quality fiction and non-fiction books and providing teachers with teaching guides and student partner discussion guides for these books. Effective use of these books in the classroom is facilitated by sustained professional development for teachers that includes follow-up in-classroom assistance from peer coaches. The materials and professional development make it possible for teachers to use mastery-oriented activities, instructional practices, peer assistance processes, and assessments that help students become more strategic readers with better comprehension of what they read. One quantitative measure of teachers’ use of these “key practices in RELA” can be derived from students’ responses to items from the annual survey of classroom activities that was conducted in the Talent Development and comparison middle schools. (The survey also queried students about

**Table 4.** Mean Key Practice Composite Scores for English/Language Arts Classes at Talent Development and Comparison Middle Schools (SD).

Year	Type of School		<i>t</i>	Effect Size
	Talent Development	Comparison		
1997–1998	2.5 (0.43) <i>n</i> = 73 classes	2.0 (0.47) <i>n</i> = 68 classes	5.90 <sup>***</sup>	1.1
1998–1999	2.4 (0.40) <i>n</i> = 120 classes	1.8 (0.55) <i>n</i> = 108 classes	9.21 <sup>***</sup>	1.1
1999–2000	2.3 (0.35) <i>n</i> = 116 classes	1.9 (0.51) <i>n</i> = 118 classes	6.72 <sup>***</sup>	0.78
2000–2001	2.2 (0.36) <i>n</i> = 111 classes	1.9 (0.48) <i>n</i> = 123 classes	5.58 <sup>***</sup>	0.62

*Note:* Key practice data were collected in just four of the six schools in 1997–1998 and in all six schools in each succeeding year. Composite scores are based on students' responses on a spring survey. Students were asked to tell, "how often the following things happened in English or Language Arts class this school year." Each class was assigned a score that represented the mean response of the students in the class to the following survey items: "Students read aloud part of a book with a partner; Students discussed a book with a partner; Students worked in teams to master the vocabulary used in a book; Students composed meaningful sentences using vocabulary words from a book; After reading part of a book, students made predictions about what might happen in the rest of the book; Students explained answers to their teammates and checked to make sure that all their teammates understood the material; Students took turns with partners asking questions, and answering the questions the partners asked." The response scale was: "never (0); once or twice a month (1); once or twice a week (2), most days (3), every day (4)."

<sup>\*\*\*</sup>  $p < 0.001$ .

their learning opportunities and experiences in science, social studies, and math.) Each class was assigned a score that represented the mean response of the students in the class to seven survey items that asked them to report how often certain key practices were implemented in English or language arts class. As can be seen in Table 4, students in Talent Development schools reported much higher use of these practices than did students in the comparison schools during each of the four years studied. Students reported experiencing the typical key practice more than twice a week. However, students' reported a noticeable decline in the use of these practices during the 3rd and 4th years of the reform. This decline is partly due to the high teacher turnover that occurs in high poverty middle schools over time. (By the fourth year of this study, about one-third of the RELA teachers in these schools were in their very first year of teaching Student Team Literature because they were new to the school and/or new to teaching RELA.) Anecdotal evidence (from the curriculum coaches) suggests that the decline in use of the measured "key practices" is also due to experienced Student Team Literature users "branching out" during these years to include a variety of new practices in their instructional repertoire (such as literature circles and writing workshops) that are not tapped by the items in this composite.

## Study 3: Motivation-Related Outcomes

1  
2  
3 Given Carol Midgley's enduring interest in student motivation, it would be fitting  
4 to include here a detailed assessment of motivation-related outcomes in Talent  
5 Development and comparison middle schools. Carol would want to know about  
6 the personal goals of the students in our sample and their perceptions of the  
7 goal structure in their classrooms (Midgley, 2002). She would want to assess  
8 the degree to which they embrace help, novelty, and challenge (e.g, Gheen &  
9 Midgley, 1999; Ryan, Hicks & Midgley, 1997). She would want to know if the  
10 English teachers in our sample combined a positive interpersonal climate with  
11 a strong emphasis on mastery, learning, and understanding (Midgley, 2001) to  
12 communicate *pedagogical caring* – (Wentzel, 1997, “my teacher cares about us  
13 and our learning”). Finally, because of her early work on expectancy-value models  
14 of motivation, she would also be interested in assessing students' expectancy for  
15 learning in English class, and their perceptions of the intrinsic and utility value of  
16 the tasks they are given in English class.

Pl. check the refs.  
“Gheen &  
Midgley, 1999;  
Ryan, Hicks &  
Midgley, 1997,  
2001, Wentzel,  
1997”, which are  
missing in the ref.  
list.

17 Unfortunately, the measures of motivation available to us from this sample  
18 were limited. Most of the annual student questionnaire was devoted to assessing  
19 the frequency of “key practices” in English, math, science, and social studies  
20 classes. However, in one TD school and one control school, we were also able to  
21 collect modest amounts of longitudinal data on motivation-related constructs. We  
22 were able to gather more extensive data in these two schools because they agreed  
23 to devote more time than the other schools to survey administration in the first  
24 three years. Both of these schools were 5–8 rather than 6–8 schools.

25 The motivation-related outcomes measured included indicators of selected  
26 expectancy-value constructs (*Expectancy for Learning* – “if I work hard in this  
27 class, I can learn a lot”; *Task-Specific Expectancies* – “I feel I am better at reading  
28 and comprehension because of activities in my English/Language Arts class,” “It  
29 helps my learning to discuss what I read with my classmates,” “I learn how to use  
30 new words by writing meaningful sentences,” “I'm learning about how writers  
31 write”; *Intrinsic Value* – “English/Language Arts class is interesting, exciting, and  
32 enjoyable”; and *Utility Value* – “the class is useful and helps prepare me for the  
33 future”). In addition, we measured *Effort* (“I'm working hard to learn about this  
34 subject”), *Peer Support for Achievement* (“My classmates believe it is important  
35 to come to school every day, want me to be a good student, and want to help  
36 me do my best work”), and *Pedagogical Caring* (“My teacher cares and is doing  
37 everything she can to help us improve our skills and increase our understanding”).

38 For each outcome except our composite measure of *Task Specific Expectancies*,  
39 data were available from both Spring 1998 and Spring 2000. The regression  
40 analyses reported here predict students' motivation-related outcomes in Spring

**Table 5.** Multiple Regression Model Predicting Expectancy for Learning in Spring 2000.

Variable	<i>B</i>	<i>SE B</i>	$\beta$ or Effect Size (ES)	<i>p</i>
Intercept	5.23	0.30		0.000
Prior expectancy for learning in Spring 1998	0.15	0.05	$\beta = 0.16$	0.001
Talent development	0.37	0.12	ES = 0.28	0.003
Student characteristics				
Female	-0.01	0.11	ES = -0.01	0.910
Seventh grader in Spring 2000	-0.06	0.11	ES = -0.06	0.604
English language learner	0.61	0.31	ES = 0.47	0.049

*Note:* Expectancy for Learning was measured by students' response to the statement, "If I work hard in English language arts class, I can learn a lot." The response scale ranged from 1 (strongly disagree) to 7 (strongly agree).

2000 (as 7th- or 8th-graders) while controlling for students' prior scores on these outcomes (except in the analysis of *Task Specific Expectancies*) in Spring 1998 and for students' gender, grade level, and English Language Learner status.

The Talent Development program had a positive impact on *Expectancy for Learning* (Table 5) and *Pedagogical Caring* (Table 6) in RELA class. Talent Development students scored about three tenths of a standard deviation higher on both of these outcomes than did comparison students. One's prior scores on these outcomes and one's English Language Learner status were also significant predictors. No significant sex differences were observed. Students who entered

**Table 6.** Multiple Regression Model Predicting Pedagogical Caring in Spring 2000.

Variable	<i>B</i>	<i>SE B</i>	$\beta$ or Effect Size	<i>p</i>
Intercept	4.42	0.40		0.000
Prior pedagogical caring in Spring 1998	0.20	0.06	$\beta = 0.15$	0.002
Talent development	0.40	0.16	ES = 0.27	0.009
Student characteristics				
Female	0.01	0.14	ES = 0.01	0.917
Seventh grader in Spring 2000	-0.31	0.15	ES = -0.21	0.036
English language learner	0.74	0.36	ES = 0.49	0.043

*Note:* We measure Pedagogical Caring with a two-item composite: "My English/Language Arts teacher cares about how we feel" and "My English/Language Arts teacher does everything she or he can to help us improve our skills and increase our understanding." The response scale ranged from 1 (almost never) to 7 (almost always).

1 this study as fifth-graders experienced less of an increase in Pedagogical Caring  
2 than did students who entered this study as sixth-graders.

3 Additional analyses indicate that Talent Development students experienced  
4 higher *Peer Support for Achievement* in their RELA class than did comparison  
5 students (effect size = 0.32,  $p = 0.002$ ) and higher *Task-Specific Expectancies*  
6 (effect size = 0.33,  $p = 0.001$ ). On the other hand, the Talent Development  
7 program had no significant impact on students' perceptions of the *intrinsic value*  
8 or *utility value* of RELA class nor on their self-reported *effort* in RELA.

9 In sum, the Talent Development program impacted peer support for learning  
10 and students' expectancies for learning in English class but not perceptions of the  
11 intrinsic or utility value of the class nor their perceptions of how hard they were  
12 working. This pattern of findings suggests that mastery-focused instructional  
13 programs such as *Student Team Literature* are not necessarily perceived as more  
14 interesting, exciting, enjoyable or useful by students even when these programs are  
15 effective in raising expectancies and achievement. A laser-like focus on learning  
16 and understanding may lead teachers to skip some engaging tangents and some  
17 "exciting" extension activities, if the tangent or activity is unlikely to add value to  
18 students' learning or understanding. Furthermore, understanding-focused lessons  
19 and assignments allow students to learn more than before even if their level of  
20 effort remains about the same. These findings are a useful reminder that although  
21 expectancies and values and effort are highly correlated in some contexts, they  
22 are distinct outcomes. Similarly, it must be noted "engagement goals" and "utility  
23 goals" are distinct from "mastery goals." For example, teachers or students who  
24 emphasize engagement goals will be content if students are interested in their  
25 work and enjoying class, even if little learning is occurring. Perhaps, that is why  
26 a fluff-filled "Crayola curriculum" is still prevalent even in middle school.

27  
28  
29  
30

## DISCUSSION

31 There has been little research in high poverty middle schools on the impact of  
32 mastery-oriented reforms of curriculum, instruction, and professional develop-  
33 ment across multiple schools and multiple years. Yet, it is in these schools that  
34 reform must ultimately succeed if the twin goals of raising adolescent literacy  
35 and closing reading achievement gaps are to be realized. The positive impacts  
36 found in all three studies suggest that low-performing urban middle schools that  
37 serve high poverty neighborhoods can realize substantial and systematic im-  
38 provements in adolescent literacy, classroom instruction, and student motivation  
39 by implementing mastery-oriented reforms to the technical core of schooling  
40 – by changing curriculum, instructional materials, academic learning time, and

1 professional development – and by creating communal, supportive, “no-excuses”  
2 learning environments.

3 In their book, *Transforming School Cultures*, Maehr and Midgley (1996) argue  
4 that the foundation of successful and sustainable school reform is to alter the  
5 thinking of educators and students. Specifically, they suggest that school reform  
6 efforts need to alter educators’ and students’: (1) perceptions of the options  
7 and alternatives available to them; (2) thoughts about self; and (3) purposes,  
8 values, and goals.

9 For example, teacher’s actions in the classroom “are largely a result of the  
10 options they think they have . . . To change, teachers and staff must be aware of and  
11 ultimately embrace another realistic option that is viewed not only as acceptable  
12 but in some sense better.” (Maehr & Midgley, 1996, pp. 201–202). This is why,  
13 to improve the learning opportunities and instructional methods that teachers  
14 provide, it is so important to provide teachers with useful tools – such as book-  
15 specific Partner Discussion Guides and cooperative learning structures and cycles  
16 of instruction – that make the “new and improved” options doable and attractive.  
17 Sustained professional development which includes modeling and simulations of  
18 the new opportunities and methods accompanied by in-classroom coaching and  
19 real-word demonstrations of the new options enacted in one’s own class or school  
20 are important in helping teachers develop new mental models of what can and  
21 should be done and to provide credible answers to teacher’s questions (How would  
22 my students respond?) and workable solutions to obstacles (How could I manage a  
23 cooperative classroom when I can’t even manage a traditional classroom?) Reform  
24 concepts are not enough. Without reform tools and professional development  
25 and coaching that gives teachers “a model to emulate” and “adaptable, adoptable  
26 routines with which they can identify” (Maehr & Midgley, 1996, p. 206), most  
27 teachers will conclude that they don’t have the energy, competence, or will to  
28 make major changes.

29 Of course, one function of the high quality materials, professional development,  
30 and coaching offered to teachers in Talent Development Schools is to enhance their  
31 sense of competence by giving them “in-depth and focused exposure to concrete  
32 examples that embody new possibilities” (Maehr & Midgley, 1996, p. 206). As  
33 a result, teachers come to believe that there is a reasonable chance of success  
34 if they implement Talent Development’s instructional programs. Similarly, one  
35 important impact of the Talent Development Model’s communal organization  
36 structure is to promote closer, longer-lasting relationships between students that  
37 allow them to develop trust, a shared sense of purpose, and common goals. This  
38 provides teachers with a “psychological safety net” (Maehr & Midgley, 1996,  
39 p. 205), a confidence that it’s safe to take instructional risks with one’s students  
40 because “we give each other some slack” when trying new things.

1 The results reported here bear witness to the promise of this approach to  
2 school reform. Using students as observers of their own classes, we found that  
3 teachers implemented hoped-for key practices much more than did teachers in the  
4 comparison schools. Despite all the turmoil experienced by urban schools, these  
5 differences in instructional practices were sustained at a reasonable level across  
6 four years and across three pairs of schools.

7 Perhaps just as important, students in Talent Development Schools reported a  
8 different culture in their school – a culture characterized by teachers who exhibit  
9 pedagogical caring and by peers who actively support achievement. A culture  
10 where students reported that their own expectancy for learning was high – they  
11 were confident that their own effort to learn was resulting in them becoming  
12 more proficient readers and better writers. These are major accomplishments. The  
13 alienation between teachers and students in many high-poverty middle schools is  
14 infamous. Classes where peer support for achievement is high and where students  
15 know that “if I work hard, I can learn a lot” are remarkably hard to find (Coleman,  
16 1993; Wilson & Corbett, 2001). But, the results reported here show that it  
17 is possible to create a much more supportive learning environment in these  
18 schools.

19 The most important finding of all was that students in Talent Development  
20 Schools learned a remarkable amount – as evidenced by their impressive “catch  
21 up gains” in reading achievement that made it possible for them to “beat the odds”  
22 (as reflected by exceeding norms for achievement gains, both statewide norms  
23 and norms from matched comparison schools). As a result, Talent Development  
24 students left middle school with substantially more skill and understanding than  
25 when they began middle school.

26 Despite this encouraging evidence that “adequate yearly progress” toward  
27 proficiency can actually be attained and sustained, we are sobered by how far  
28 some middle school students still need to go to reach a solid level of understanding  
29 and proficiency. Talent Development Middle Schools were able to lower the per-  
30 centage of students performing at the “below basic” proficiency level from 79% as  
31 fifth-graders to 57% as eighth-graders. This track record was substantially better  
32 than that in the comparison schools where 75% of the students were below basic  
33 as fifth graders and 63% as eighth-graders. Nonetheless, it is clear that reformers,  
34 educators, and parents must work together to develop even more opportunities  
35 for students to receive effective extra help (during the school day, after-school,  
36 on Saturdays and during the summer), so that even students with the weakest  
37 understanding can reach at least a basic level of proficiency before reaching high  
38 school. Having 57% of students from reformed high-poverty middle schools  
39 entering high school without a basic foundation of mastery, though a significant  
40 improvement and a major accomplishment for these schools, is still too many.

1 We hope others will join us in developing and researching scaleable, mastery-  
 2 oriented programs that help teachers, administrators, students, and parents to  
 3 become learning-focused and receive the opportunities and supports they need  
 4 in order for learning to flourish in our nation’s high poverty middle schools. As  
 5 Carol Midgley (2002, p. 54) once said, “If the same national commitment, media  
 6 attention, and financial support were put into helping middle school educators  
 7 provide a mastery-focused learning environment as has been put into the high  
 8 stakes testing movement, we would be well on our way to providing highly  
 9 effective middle schools for all young adolescents.” Let us work together to make  
 10 it so!

## 11 12 13 ACKNOWLEDGMENTS

14 This chapter is based upon research supported by grants and contracts from the  
 15 U.S. Department of Education. The opinions expressed herein do not necessarily  
 16 reflect the views of the Department or any other agency of the U.S. Government.  
 17 Not only do we thank the Department, we also thank our colleagues at the  
 18 Philadelphia Education Fund and the educators and school and district leaders  
 19 that serve Philadelphia’s Talent Development Schools – together we are making  
 20 a big and sustainable difference.

For middle and high school educators searching for ways to promote literacy, *Adolescent Literacy Resources: Linking Research and Practice* bridges the divide between what the research says works and what is happening in the most of today's content-area classrooms. Secondary school educators too often find that their students do not have the necessary literacy skills to use reading and writing effectively to learn subject matter. Educators know that something needs to be done but, understandably, are daunted by the considerable task of identifying and applying research-based literacy strategies. It builds on *The Teen Years Explained: A Guide to Healthy Adolescent Development*, the seminal report developed by the Center for Adolescent Health at the Johns Hopkins Bloomberg School of Public Health, as well as on other important sources of information. The document focuses specifically on five areas of adolescent development: 1. EMOTIONAL. how adolescents process emotions and stress. SOCIAL. changes in familial, social, and romantic relationships. Strong economic growth therefore advances human development, which, in turn, promotes economic growth. But under different conditions, similar rates of growth can have very different effects on poverty, the employment prospects of the poor and broader indicators of human development. New science offers better prospects across both productive and service sectors. The central lesson from the past 50 years of development research and policy is that economic growth is the most effective way to pull people out of poverty and deliver on their wider objectives for a better life. The impact of the distribution of income on this relationship in particular, whether higher inequality lessens the reduction in poverty generated by growth is less clear.

Self-Efficacy Development in Adolescence Dale H. Schunk and Judith L. Meece. In this chapter, the authors begin by defining adolescence and noting that it is a time of great changes: personal (physical, cognitive, social, emotional), academic (school transitions, responsibility, independence), self-identity, peer friendships. The Impact of Perceived Family Efficacy Beliefs on Adolescent Development Gian Vittorio Caprara, Eugenia Scabini, and Camillo Regalia. In this chapters, the authors address filial efficacy, parental self-efficacy, and collective efficacy, primarily drawing on finding from their own longitudinal project and related studies. When they enter high school, social support received from friends becomes important. Part 2 Guidelines: The Development and Implementation of Life Skills. Programmes . . . 9. Even in countries where a significant proportion of children do not complete schooling, the introduction of life skills education in schools should be a priority. Life skills education is highly relevant to the daily needs of young people. When it is part of the school curriculum, the indications are that it helps to prevent school drop-out. Furthermore, once experience has been gained in the development and implementation of a life skills programme for schools, this may help with the creation and implementation of programmes for other settings; Developing life skills programmes. Developing adolescent literacy in high poverty middle schools: the impact of talent development's reforms across multiple years and sites. Article. Jan 2004. Middle schools reform efforts argue that many middle schools have improved the climate of their school, particularly relations between teachers and students, but few have changed their instructional practices. Finally, the reforms appear very promising, and results of some of the early evaluations of their effects have been quite positive. Continuing such work is a priority for the new millennium. View. Developing adolescent literacy in high-poverty middle schools: The impact of Talent Development's reforms across multiple years and sites. Pintrich and M.L. Maehr (Eds.), *Motivating students, improving schools: The legacy of Carol Midgley (Advances in Motivation and Achievement, 13)*, 185-207. Oxford, U.K.: Elsevier.
